EARLY SPRING

On our first visit we will apply Redenta's Organic Fertilizer at a rate of 20-25 pounds per 1000 square feet. Organic granular fertilizers slowly release a mixture of organic nutrients into the ground that continuously work to build a healthy soil.

SPRING

The second treatment of the year consists of a liquid fertilizer (typically **John's Recipe**) that is sprayed on the lawn and on all plants, shrubs and ornamental trees. John's Recipe is a blend of both hydrolyzed and emulsified fish, seaweed, molasses, humate and Medina Soil Activator. Foliar spraying encourages plant growth and health, reduces stress, and helps build up tolerance to extremes in weather.

EARLY SUMMER

We will apply Redenta's Organic Fertilizer as we did on the Early Spring visit.

LATE SUMMER

We will apply dry molasses. Microbes love sugar and it's an excellent carbon source that stimulates beneficial organisms after a hot summer.

FALL

The last treatment includes foliar spray as in the Spring treatment but on this visit we also apply an organic fall fertilizer to prepare your landscape for winter.

ORGANIC FERTILIZATION SERVICE

Our fertilization service stops by five times a year. Sometimes the application is granular, sometimes liquid. By mixing it up like this, the plants and soil get a variety of nutrients and the right fertilizer is applied at the right time of year. For more information, talk to someone at the store or contact us at (817) 882-6634 or care@redentas.com.

There's nothing new about Organic Gardening. Your great grandmother used composted manure from the barn to enrich the soil in her vegetable garden. Today, using that same approach, organic gardeners add organic material to create a rich, balanced soil that provides turf and plants with the nutrients they need when they need them. The improved soil encourages vigorous root growth helping plants grow strong to ward off pests and diseases. And, it works! When your soil comes back into its normal balance, you will have a lush, vigorous lawn and a garden your kids and pets can enjoy without any health concerns.

Chemical fertilizers provide a "junk food" jolt of rapid green up but nothing lasting for the soil and not much for root growth. Chemical pesticides kill harmful insects as well as beneficial insects. Some have had such serious health risks for humans they have been taken off the market. Ever notice that chemical fertilization companies leave a sign in the lawn warning people to keep off for a period of time after their service?
